EE22BTECH11004 - Allu Lohith

Consider a closed-loop system as shown,

So,

$$G_p(s) = \frac{14.4}{s(1 + 0.1s)}$$

is the plant transfer function and $G_c(s) = 1$ is the compensator. For a unit-step input, the output response has damped oscillations. The damped natural frequency is _____ rad/s. (Round off to 2 decimal places.)

$$E = \frac{Cs(1 + 0.1s)}{14.4} \quad (3)$$

$$\frac{Cs(1 + 0.1s)}{14.4} = R - C \quad (4)$$

$$R = C \left(\frac{s(1 + 0.1s)}{14.4} + 1 \right) \quad (5)$$

$$\frac{C}{R} = \frac{14.4}{0.1s^2 + s + 14.4} \quad (6)$$

The characteristic equation is $0.1s^2 + s + 14.4$ which is of the form $s^2 + 2\zeta\omega_n s + \omega_n^2$, So

$$\omega_n^2 = 144 \quad (7)$$

$$\omega_n = 12 \text{ rad/s} \quad (8)$$

Solution: As we know that:

Parameter	Description	Value
$G_n(s)$	Plant transfer function	$\frac{14.4}{s(1 + 0.1s)}$
$G_c(s)$	Transfer function of the compensator	1
ω_n	Damped natural frequency	-
T	Overall transfer function	$\frac{C}{R}$
